

Jordan Lee - 2026 Application Packet

Applicant Profile

Jordan Lee
jordan.lee@example.com
Redwood Community College
Computer Science
GPA: 3.62

Resume

Current resume included in PDF format. Experience includes peer technology tutoring and robotics project leadership.

Unofficial Transcript

Enrolled during the 2026 academic year. Expected graduation: May 2027. Cumulative GPA: 3.62.

Essay

Engineering gives communities a practical way to turn shared concerns into systems that improve everyday life. I became interested in engineering after helping my neighborhood association measure heat around local bus stops. Several stops had no shade, and older residents often waited in direct sunlight. I built a simple sensor enclosure, collected temperature readings, and organized the results so volunteers could understand the pattern. That experience taught me that technical work matters most when it begins with listening. A sensor does not solve a problem by itself. People must trust the method, understand the evidence, and see how it connects to a decision. I want to study computer engineering so I can build tools that make local information easier to collect and act on. My next project would combine low-cost hardware with a public dashboard showing heat, air quality, and shade coverage near common walking routes. I would work with students, neighborhood groups, and city staff to decide where sensors belong and how the findings should be explained. The project would publish methods, limitations, and uncertainty instead of presenting measurements as perfect. Engineering can improve my community by making problems visible, giving residents better evidence, and helping limited resources reach the places where they matter most. I also want younger students to see engineering as something they can use before they become experts. Through workshops, I would show them how to assemble simple sensors, question the data, and propose improvements. Clear documentation and respectful collaboration would be treated as core technical requirements. Every design decision should connect back to a real person and a real need. Testing with community members would reveal problems that a classroom prototype might miss. The strongest solutions are useful, understandable, repairable, and honest about their limits. Clear documentation and respectful collaboration would be treated as core technical requirements. Every design decision should connect back to a real person and a real need. Testing with community members would reveal problems that a classroom prototype might miss. The strongest solutions are useful, understandable, repairable, and honest about their limits.
